+ TICK = 0.1 MIL (1 CLICK)

This bar is 4 in. Print at 100 percent, never Fit to page.

Shooting a target for GroupLab

Thank you for shooting a sheet for GroupLab. This page goes with the sheet printed beside it, and tells you everything you need.

Print it

- Print the sheet at actual size, 100 percent, never Fit to page.
- Measure the bar under the grid with a ruler: it is 4 in, or 10 cm on a metric sheet, as printed beside it. If it is not, the printer scaled the sheet: print it again at actual size.

Mount it

- Mount the sheet on a backer. Flat is best, but GroupLab follows a gentle curl.

Shoot it

- Shoot one group at the diamond. Adjust the scope from the grid if you like, and shoot again on a fresh sheet.
- Write nothing on this sheet; name the load when you send it. Put nothing else on the sheet.

Photograph it

- In GroupLab on your phone, choose Take a picture. Guided takes the picture itself when everything is right; Manual waits for you.
- Keep the whole sheet and all its corner squares in view. The torch helps in dim light; Auto turns it on for you.
- After each picture GroupLab gives it a score and says what it corrected. Take it again only if it asks you to.
- No GroupLab on your phone? Take two photographs from about 2.5 ft (75 cm) on the main camera, uncropped, and never through a messaging app.

Scan it, if you can

- If you have a flatbed scanner, add one flat scan of the sheet at 600 dpi.

Send it

- Send it from GroupLab's result, or upload the photographs, and the scan if you made one, at <https://grouplab.org/targets>.
- Submitting means following the terms on that page.
